

*Scrophularia clematidifolia* (Scrophulariaceae) has been rediscovered in Hatay, Turkey. It is closely related to *Scrophularia scopolii* var. *nusairiensis*, but it clearly differs from the other species in terms of leaves, inflorescence and fruit features. A taxonomic description, some photographs of the species, geographical distribution and habitat features are given. Additionally, seed macro-morphology and pollen characteristics of *S. clematidifolia* are compared with the close relative species using light microscopy (LM) and scanning electron microscopy (SEM).
